

Using JSON in Django

1. Manually serialize course data for the `sio` application:
 - Write a Django template file that could be used to generate a JSON response describing an arbitrary set of courses.
 - Create a `get_all_courses` action to use the template to generate a JSON response for all courses.
2. Use Django's built-in serializers to generate a JSON response for all courses.
 - Hint: See <https://docs.djangoproject.com/en/2.1/topics/serialization/>
 - Hint: This method does not use the `render` function or a Django template file.
